$Health \leftrightarrows Productivity$

What do we mean by health?

- self-reported health
- development of illness (e.g., heart disease, diabetes) or disability
- chronic conditions (e.g., back pain, sleep apnea, obesity)
- mental health (e.g., depression, stress, anxiety)

Empirical Approach and Data

Pros and Cons of the Body Mass Index (BMI)

• A function of weight & height; independent of age & gender

$$\mathsf{BMI} = \frac{\mathsf{weight}\;(\mathsf{kg})}{\mathsf{height}^2\;(\mathsf{m}^2)} = \frac{\mathsf{weight}\;(\mathsf{lb}) \times 703}{\mathsf{height}^2\;(\mathsf{in}^2)}$$

- A simple means for classifying (sedentary) individuals $\begin{array}{l} \mathsf{BMI} < 18.5: \text{ underweight} \\ 18.5 \leq \mathsf{BMI} < 25.0: \text{ ideal weight} \\ 25.0 \leq \mathsf{BMI} < 30.0: \text{ overweight} \\ \mathsf{BMI} \geq 30.0: \text{ obese} \end{array}$
- May over/under estimate in those with more/less lean body mass
- May only have self-reported weight & height (subjective measure, rounding issues)

Other measures:

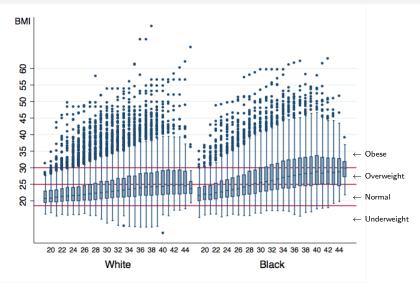

- skinfold, underwater weighing, fat-free mass, body volume/location

Empirical Approach and Data

Estimation 00000000000 Results 0000000000000000

Body Mass as Females Age

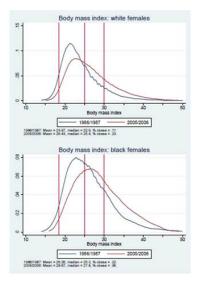

(using same individuals followed over time from authors' NLSY79 data)

Empirical Approach and Data

Estimation 00000000000 Results

Distribution of Body Mass over Time (using repeated cross sections from NHIS data)

Source: DiNardo, Garlick, Stange (2010)

Density in black: 1986/1987 Density in red: 2005/2006 Vertical lines: BMI thresholds

- The distribution of BMI is changing over time.
- The mean and median have increased significantly.
- The right tail has thickened (larger percent obese).

Empirical Approach and Data

Estimation 00000000000 Results

What do we know about body mass and wages?

- Evidence in the economic literature that wages of white women are negatively correlated with BMI. (Cawley, 2004)
- Evidence that wages of white men, white women, and black women are negatively correlated with body fat and positively correlated with fat-free mass. (Johansson, et al., 2009; Wada and Tekin, 2010)
- Evidence among males and females that weight-related wage disparities differ at different wage levels and by occupation. (Johar and Katayama, 2012)
- Evidence that negative wage penalties associated with body mass change with age for both men and women. (Gregory and Ruhm, 2011)

Thus, there is some evidence of wage disparity by body mass... *contemporaneously*.

What might the contemporaneous "wage gap" represent?

▲ロト ▲帰ト ▲ヨト ▲ヨト 三回日 のの⊙

• Observed differences in productivity

Empirical Approach and Data

Estimation 000000000000 Results

Unobserved Heterogeneity

(Discrete Factor Random Effects: Heckman and Singer, 1984; Guilkey and Mroz, 1992; Mroz, 1999)

- Permanent: rate of time preference, genetics
- Time-varying: unmodeled stressors, health shocks

The unobserved part of equation e, u_t^e , is decomposed into three components:

$$u_t^e = \rho^e \mu + \omega^e \nu_t + \epsilon_t^e$$

Empirical Approach and Data

Estimation 000000000000 Results

Unobserved Heterogeneity

(Discrete Factor Random Effects: Heckman and Singer, 1984; Guilkey and Mroz, 1992; Mroz, 1999)

- Permanent: rate of time preference, genetics
- Time-varying: unmodeled stressors, health shocks

The unobserved part of equation e, u_t^e , is decomposed into three components:

$$u_t^e = \rho^e \mu + \omega^e \nu_t + \epsilon_t^e$$

where the first two unobservables are modeled as random effects:

- permanent heterogeneity factor μ with factor loading ρ^e
- time-varying heterogeneity factor ν_t with factor loading ω^e
- iid component \(\epsilon_t^e\)

distributed $N(0, \sigma_e^2)$ for continuous equations and Extreme Value for dichotomous/polychotomous outcomes

Empirical Approach and Data

Estimation 0000000000000 Results

How should we estimate wages (and body mass index)?

OLS?

- It quantifies how variation in the rhs variables (Z) explain variation in the lhs variable (W), on average.
- It explains how the mean of W varies with Z.
- In estimation, we also recover the variance of W.
- The mean and variance of *W*, and a distributional assumption, describe the distribution of (log) offered wages.

Using OLS, we obtain the marginal effect of Z on W, on average.

Empirical Approach and Data

Estimation 0000000000000 Results

How should we estimate wages (and body mass index)?

OLS?

- It quantifies how variation in the rhs variables (Z) explain variation in the lhs variable (W), on average.
- It explains how the mean of W varies with Z.
- In estimation, we also recover the variance of W.
- The mean and variance of *W*, and a distributional assumption, describe the distribution of (log) offered wages.

Using OLS, we obtain the marginal effect of Z on W, on average.

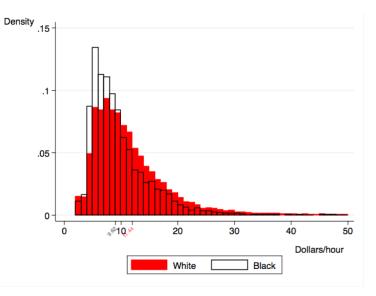

But what if Z has a different effect on W at different values of W?

- Interact Zs with γ s fully. Estimate logit equation (or hazard) for $\lambda(k, Z)$.

Empirical Approach and Data

Estimation 00000000000 Results

- Replicate each observation K times and create a 0/1 dependent variable indicating into which cell the individual's wage falls.
- Interact Zs with γ s fully. Estimate logit equation (or hazard) for $\lambda(k, Z)$.

$$E[W|Z] = \sum_{k=1}^{K} \overline{w}(k|K)\lambda(k,Z) \prod_{j=1}^{k-1} [1 - \lambda(j,Z)]$$

Simulations to determine contemporaneous effect

Consider an improvement in health (i.e., a reduction in body mass)

- Calculate (simple) marginal effect of
 - an ×% decrease in BMI,
 - or one unit decrease in BMI,
 - or going from overweight (BMI 27.5) to normal weight (BMI 24)

on wages (i.e., the contemporaneous effect).

- The contemporaneous wage penalty attributed to body mass is smaller when unobserved permanent and time-varying heterogeneity is modeled.
- The effect of a body mass reduction is different over the support of wages.
- There are sizable effects of body mass on life-cycle behaviors that also impact wages.
- These are wage impacts and not welfare impacts.

Empirical Approach and Data
