

SSSI Part 1: The Social Cost of Inequality

Nathaniel Hendren

Harvard

July, 2016

- Inequality generates need for interpersonal comparisons
 - Decisions about economic policies (R&D, free trade, mergers, safety net, health, education, taxation, etc.)
 - General measurement of societal well-being
- Two common economic methods for resolving interpersonal comparisons
 - 1 Kaldor Hicks Compensation Principle (Kaldor (1939), Hicks (1939, 1940))
 - Motivates aggregate surplus, or “efficiency”, as normative criteria
 - Ignores issues of “equity”
 - 2 Social welfare function (Bergson (1938), Samuelson (1947), Diamond and Mirrlees (1971), Saez and Stantcheva (2015))
 - Allows preference for equity
 - Subjective choice of researcher or policy-maker

- Follow Hendren (2014) “The Inequality Deflator: Interpersonal Comparisons without a Social Welfare Function”
- Revisit Kaldor-Hicks
- Modify so that transfers are incentive compatible (Mirrlees (1971))
- Kaldor and Hicks envisioned feasible transfers:
 - *“If, as will often happen, the best methods of compensation feasible involve some loss in productive efficiency, this loss will have to be taken into account. (Hicks, 1939)*
 - Existing literature: Hylland and Zeckhauser (1979), Coate (2000), Kaplow (1996, 2004, 2006, 2008)
- Provide simple (yet general) empirical method of accounting for these distortions

- Key idea: Envelope theorem allows for empirical method to account for distortions
 - Corresponds to weighting surplus by the “inequality deflator”
 - Turns unequal surplus into equal surplus using modifications to the tax schedule
- Inequality deflator is the marginal cost to government of providing \$1 of welfare to an income level
 - Differs from \$1 because of how behavioral response affects government budget (basic PF logic)
- Suppose we want to provide transfers to those earning near y^*

Modifications to Income Tax Schedule

Modifications to Income Tax Schedule

Modifications to Income Tax Schedule

Modifications to Income Tax Schedule

Modifications to Income Tax Schedule

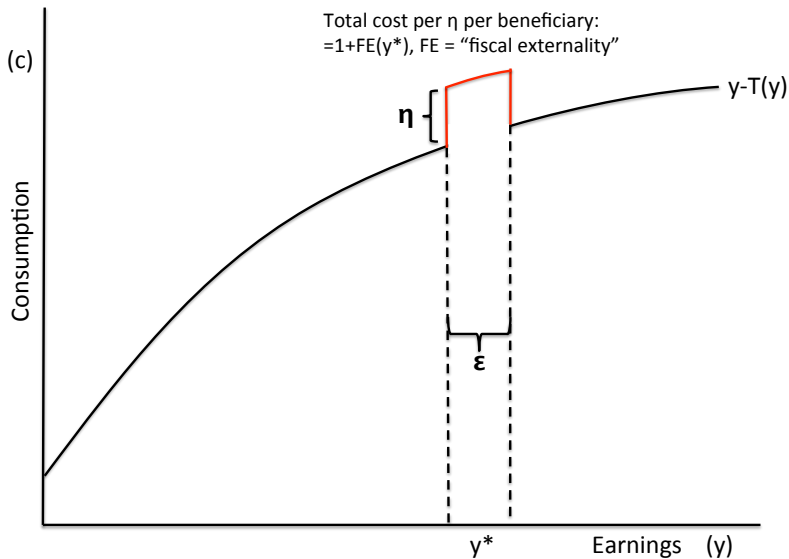

Modifications to Income Tax Schedule

Modifications to Income Tax Schedule

Modifications to Income Tax Schedule

Modifications to Income Tax Schedule

- Inequality deflator: Formal Model

$$g(y) = \frac{1 + FE(y)}{E[1 + FE(y)]}$$

- To first order: \$1 surplus to those earning y can be turned into $\$g(y) / n$ surplus to everyone through modifications to tax schedule

- Inequality deflator: Formal Model

$$g(y) = \frac{1 + FE(y)}{E[1 + FE(y)]}$$

- To first order: \$1 surplus to those earning y can be turned into $\$g(y) / n$ surplus to everyone through modifications to tax schedule
- Fiscal externality logic does not rely on functional form assumptions
 - Allows for each person to have her own utility function and arbitrary behavioral responses
 - Extends to multiple policy dimensions
 - Nests a lot of optimal tax expressions as special case (e.g. Mirrlees)

- Inequality deflator: Formal Model

$$g(y) = \frac{1 + FE(y)}{E[1 + FE(y)]}$$

- To first order: \$1 surplus to those earning y can be turned into $\$g(y) / n$ surplus to everyone through modifications to tax schedule
- Fiscal externality logic does not rely on functional form assumptions
 - Allows for each person to have her own utility function and arbitrary behavioral responses
 - Extends to multiple policy dimensions
 - Nests a lot of optimal tax expressions as special case (e.g. Mirrlees)
- Key assumption: “partial equilibrium” / “local incidence”
 - Behavioral response only induces a fiscal externality
 - Other incidence/externalities would need to be accounted for

- Inequality deflator: Formal Model

$$g(y) = \frac{1 + FE(y)}{E[1 + FE(y)]}$$

- To first order: \$1 surplus to those earning y can be turned into $\$g(y) / n$ surplus to everyone through modifications to tax schedule
- Fiscal externality logic does not rely on functional form assumptions
 - Allows for each person to have her own utility function and arbitrary behavioral responses
 - Extends to multiple policy dimensions
 - Nests a lot of optimal tax expressions as special case (e.g. Mirrlees)
- Key assumption: “partial equilibrium” / “local incidence”
 - Behavioral response only induces a fiscal externality
 - Other incidence/externalities would need to be accounted for
- Inequality Deflator can turn unequal surplus into equal surplus

Example: Alternative Environment Benefits Poor

- Given $s(y)$, two ways of neutralizing distributional comparisons

- Given $s(y)$, two ways of neutralizing distributional comparisons
- “EV”: modify status quo tax schedule

- Given $s(y)$, two ways of neutralizing distributional comparisons
- “EV”: modify status quo tax schedule
 - By how much can everyone be made better off in modified status quo world relative alternative environment?

“EV” Example

"EV" Example

“EV” Example

“EV” Example

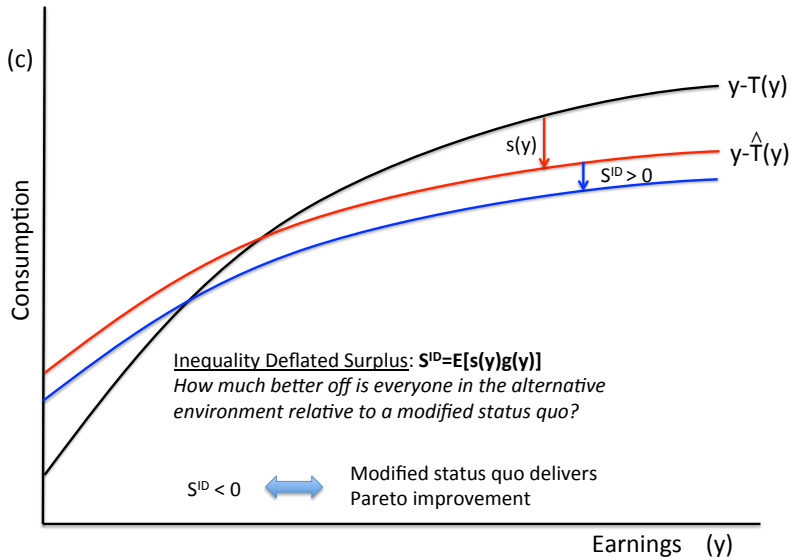

“EV” Example

“EV” Example

“EV” Example

- Given $s(y)$, two ways of neutralizing distributional comparisons
- “EV”: modify status quo tax schedule
 - By how much can everyone be made better off in modified status quo world relative alternative environment? Formal "First Order" Statement
- “CV”: modify alternative environment tax schedule
 - By how much can everyone be made better off in modified alternative environment relative to status quo?

"CV" Example

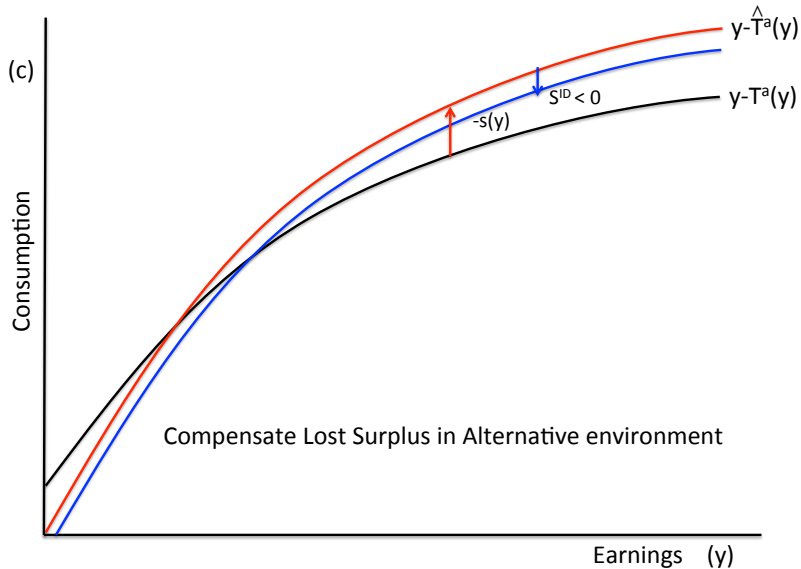

"CV" Example

"CV" Example

"CV" Example

“CV” Example

“CV” Example

Inequality Deflated Surplus \leftrightarrow Pareto Comparisons

- If $g(y)$ is similar in status quo and alternative environment, these two interpretations of inequality deflated surplus are first-order equivalent Formal Assumptions and Proposition
 - Similar to first order equivalence of CV and EV
- When surplus is homogeneous conditional on income:
 - S^{ID} provides first-order characterization of potential Pareto comparisons
 - S^{ID} quantifies difference between environments without making inter-personal comparisons
 - By how much is *everyone* better off?

Heterogeneous Surplus

- Redistribution based on income, not individual-specific
 - Two people with same income, $y(\theta)$, can have different surplus, $s(\theta)$
 - Income tax is a “blunt instrument”
 - $\int s(\theta) g(y(\theta)) =$ how much *on average* is each income level better off
 - Search for potential Pareto comparisons more difficult
 - But inequality deflator can still be used to characterize Pareto comparisons Proposition

- Define

$$\underline{S}^{ID} = E [\min \{s(\theta) | y(\theta) = y\} g(y)] > 0$$

$$\bar{S}^{ID} = E [\max \{s(\theta) | y(\theta) = y\} g(y)] < 0$$

- Modified alternative environment delivers Pareto improvement iff $\underline{S}^{ID} > 0$
- Modified status quo offers Pareto improvement iff $\bar{S}^{ID} < 0$

Heterogeneous Surplus

- No potential Pareto ranking when $\underline{S}^{ID} < 0 < \bar{S}^{ID}$
- Potential solution: Add more status quo policies
- Marginal cost $1 + FE(\mathbf{X})$ as opposed to $1 + FE(y)$
 - Augment both tax schedule and Medicaid
- Inequality deflator well-suited for comparisons in which surplus does not vary conditional on income, so that $\underline{S}^{ID} = S^{ID} = \bar{S}^{ID}$

Rough Bound from Behavioral Responses to Tax Changes

- Existing evidence on behavioral responses to taxation provides guidance on $1 + FE(y)$

Rough Bound from Behavioral Responses to Tax Changes

- Existing evidence on behavioral responses to taxation provides guidance on $1 + FE(y)$
 - EITC causes people to:
 - Enter the labor force (summary in Hotz and Scholz (2003))
 - Distort earnings (Chetty et al 2013).
 - $1 + FE(y) \approx 1.14$ for low-earners (calculation in Hendren 2013)

Rough Bound from Behavioral Responses to Tax Changes

- Existing evidence on behavioral responses to taxation provides guidance on $1 + FE(y)$
 - EITC causes people to:
 - Enter the labor force (summary in Hotz and Scholz (2003))
 - Distort earnings (Chetty et al 2013).
 - $1 + FE(y) \approx 1.14$ for low-earners (calculation in Hendren 2013)
 - Taxing top incomes causes:
 - Reduction in taxable income (review in Saez et al 2012)
 - Implies $1 + FE(y) \approx 0.50 - 0.75$
 - Disagreement about amount, but general agreement on the sign:
 $FE(y) < 0$

Rough Bound from Behavioral Responses to Tax Changes

- Existing evidence on behavioral responses to taxation provides guidance on $1 + FE(y)$
 - EITC causes people to:
 - Enter the labor force (summary in Hotz and Scholz (2003))
 - Distort earnings (Chetty et al 2013).
 - $1 + FE(y) \approx 1.14$ for low-earners (calculation in Hendren 2013)
 - Taxing top incomes causes:
 - Reduction in taxable income (review in Saez et al 2012)
 - Implies $1 + FE(y) \approx 0.50 - 0.75$
 - Disagreement about amount, but general agreement on the sign:
 $FE(y) < 0$
- **Reduced form empirical evidence suggests deflator values poor more so than the rich**

Rough Bound from Behavioral Responses to Tax Changes

- Existing evidence on behavioral responses to taxation provides guidance on $1 + FE(y)$
 - EITC causes people to:
 - Enter the labor force (summary in Hotz and Scholz (2003))
 - Distort earnings (Chetty et al 2013).
 - $1 + FE(y) \approx 1.14$ for low-earners (calculation in Hendren 2013)
 - Taxing top incomes causes:
 - Reduction in taxable income (review in Saez et al 2012)
 - Implies $1 + FE(y) \approx 0.50 - 0.75$
 - Disagreement about amount, but general agreement on the sign:
 $FE(y) < 0$
- **Reduced form empirical evidence suggests deflator values poor more so than the rich**
 - Despite evidence that taxable income elasticities may be quite stable across the income distribution (e.g. Chetty 2012)

A More Precise Representation

- Use optimal tax approach to write $FE(y)$ as function of taxable income elasticities

A More Precise Representation

- Use optimal tax approach to write $FE(y)$ as function of taxable income elasticities
- Let

$\epsilon^c(y) = \text{avg comp. elasticity for those earning } y$

$\zeta(y) = \text{avg inc. effect for those earning } y$

$\epsilon^P(y) = \text{avg LFP rate elasticity for those earning } y$

Formal Definitions

Optimal Tax Expression

For every point, y^* , such that $T'(y)$ and $\epsilon^c(y^*)$ are locally constant and the distribution of income is continuous:

$$FE(y^*) = \underbrace{-\epsilon^P(y^*) \frac{T(y) - T(0)}{y - T(y)}}_{\text{Participation Effect}} - \underbrace{\zeta(y^*) \frac{\tau(y^*)}{1 - \frac{T(y^*)}{y^*}}}_{\text{Income Effect}} - \underbrace{\epsilon^c(y^*) \frac{\tau(y^*)}{1 - \tau(y^*)} \alpha(y^*)}_{\text{Substitution Effect}}$$

where $\alpha(y) = -\left(1 + \frac{yf'(y)}{f(y)}\right)$ is the local Pareto parameter of the income distribution General Formula

- Heterogeneity in $FE(y)$ depends on:
 - 1 Shape of income distribution, $\alpha(y)$
 - 2 Shape and size of behavioral elasticities
 - 3 Shape of tax rates

Optimal Tax Expression

For every point, y^* , such that $T'(y)$ and $\epsilon^c(y^*)$ are locally constant and the distribution of income is continuous:

$$FE(y^*) = \underbrace{-\epsilon^P(y^*) \frac{T(y) - T(0)}{y - T(y)}}_{\text{Participation Effect}} - \underbrace{\zeta(y^*) \frac{\tau(y^*)}{1 - \frac{T(y^*)}{y^*}}}_{\text{Income Effect}} - \underbrace{\epsilon^c(y^*) \frac{\tau(y^*)}{1 - \tau(y^*)} \alpha(y^*)}_{\text{Substitution Effect}}$$

where $\alpha(y) = -\left(1 + \frac{yf'(y)}{f(y)}\right)$ is the local Pareto parameter of the income distribution General Formula

- Heterogeneity in $FE(y)$ depends on:
 - 1 Shape of income distribution, $\alpha(y)$
 - 2 Shape and size of behavioral elasticities
 - 3 Shape of tax rates
- Generalized version of “uni-dimensional” formulas (e.g. Bourguignon and Spadaro (2012), Zoutman (2013a, 2013b))

Estimation Approach

- Calibrate behavioral elasticities from existing literature on taxable income elasticities

Estimation Approach

- Calibrate behavioral elasticities from existing literature on taxable income elasticities
 - Assess robustness to range of estimates (e.g. compensated elasticity of 0.1, 0.3, and 0.5) [Calibration Details](#)

Estimation Approach

- Calibrate behavioral elasticities from existing literature on taxable income elasticities
 - Assess robustness to range of estimates (e.g. compensated elasticity of 0.1, 0.3, and 0.5) [Calibration Details](#)
- Estimate shape of income distribution and marginal income tax rate using universe of US income tax returns

Estimation Approach

- Calibrate behavioral elasticities from existing literature on taxable income elasticities
 - Assess robustness to range of estimates (e.g. compensated elasticity of 0.1, 0.3, and 0.5) [Calibration Details](#)
- Estimate shape of income distribution and marginal income tax rate using universe of US income tax returns
 - Account for covariance between elasticity of income distribution and marginal tax rate [Estimation Details](#)

Inequality Deflator

Inequality Deflator

Application #1: Income Inequality

Source: CBO; Supplemental Tables 43373, Table 7

1. Income Distributions

- Define surplus function

$$s(\theta) = Q_a(\alpha(\theta)) - Q_0(\alpha(\theta))$$

1. Income Distributions

- Define surplus function

$$s(\theta) = Q_a(\alpha(\theta)) - Q_0(\alpha(\theta))$$

- How much growth if tax schedule distributed it equally?

1. Income Distributions

- Define surplus function

$$s(\theta) = Q_a(\alpha(\theta)) - Q_0(\alpha(\theta))$$

- How much growth if tax schedule distributed it equally?
 - Could do other counterfactual experiments...

1. Income Distributions

- Define surplus function

$$s(\theta) = Q_a(\alpha(\theta)) - Q_0(\alpha(\theta))$$

- How much growth if tax schedule distributed it equally?
 - Could do other counterfactual experiments...
 - Search for Pareto comparisons using particular counterfactuals (e.g. SBTC vs no SBTC)

1. Income Distributions

- Define surplus function

$$s(\theta) = Q_a(\alpha(\theta)) - Q_0(\alpha(\theta))$$

- How much growth if tax schedule distributed it equally?
 - Could do other counterfactual experiments...
 - Search for Pareto comparisons using particular counterfactuals (e.g. SBTC vs no SBTC)
- Quantile stability implements Kaldor (1939)'s idea of holding distribution constant + Hicks (1939) idea of doing it in cheapest manner possible

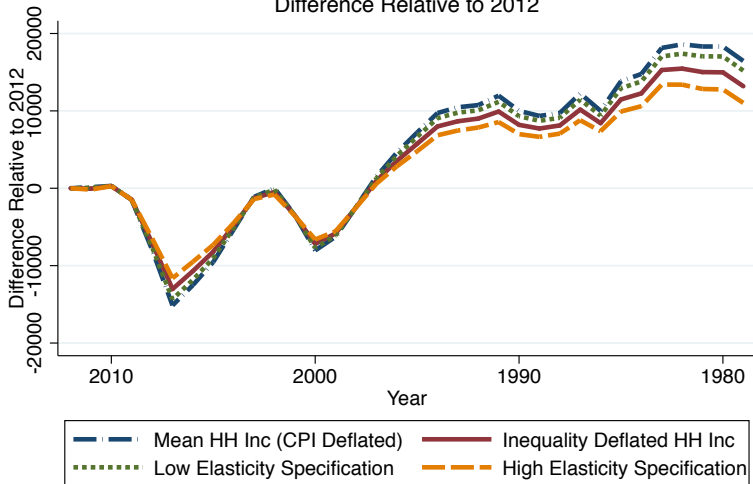

1. Income Distributions

- Define surplus function

$$s(\theta) = Q_a(\alpha(\theta)) - Q_0(\alpha(\theta))$$

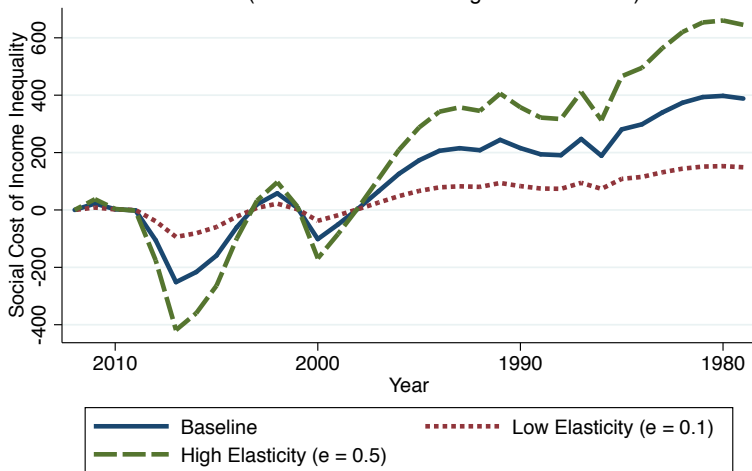

- How much growth if tax schedule distributed it equally?
 - Could do other counterfactual experiments...
 - Search for Pareto comparisons using particular counterfactuals (e.g. SBTC vs no SBTC)
- Quantile stability implements Kaldor (1939)'s idea of holding distribution constant + Hicks (1939) idea of doing it in cheapest manner possible
 - More costly to make the rich poor and the poor rich than to keep everyone rich and poor

Raw and Deflated Household Income Change Difference Relative to 2012

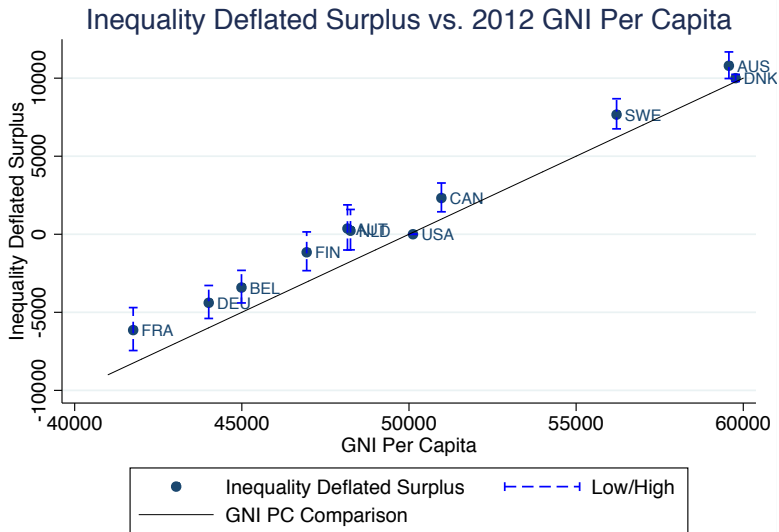

Social Cost of Increased Income Inequality

Social Cost of Increased Income Inequality
119K * (Mean - Deflated Change in HH Income)

Country Comparison to US

Example: Producer versus Consumer Surplus

- Suppose budget neutral policy with benefits to producers S^P and consumers S^C
 - Extreme assumption: producer surplus falls to top 1%
 - Consumer surplus falls evenly across income distribution
- Optimal weighting:
$$S^{ID} = 0.77S^P + S^C$$
- “Consumer surplus standard” requires top tax rate near Laffer curve
 - France should have tighter merger regulations?
- Key assumption: policy is budget neutral (inclusive of fiscal externalities)
- What about non-budget neutral policies?

Targeted Policies

- Suppose G affects those with income y
- Construct

$$MVPF_G = \frac{s(y)}{1 + FE^G}$$

- WTP per unit gov't revenue (Mayshar 1990; Slemrod and Yitzhaki 2001; Hendren 2013)
 - Depends on causal effects (FE^G) and WTP for non-market good
- Additional spending on G desirable iff

$$\underbrace{MVPF_G}_{\text{Value of } G} \geq \frac{1}{\underbrace{1 + FE(y)}_{\text{Value of } T(y)}}$$

Source: MVPFs compiled in Hendren (2013) drawing on existing estimates from Bloom et al (1997), Hoynes and Schanzenbach (2012), and Jacob and Ludwig (2012)
Income is average income of policy beneficiaries normalized to 2012 income using CPI-U

- Inequality isn't just a transfer!
- Policy implications
 - Compare policies to the efficiency of the tax schedule
 - Weighting individual WTP by inequality deflator provides method to do this
- **General idea: use marginal costs of feasible redistribution + envelope theorem + Pareto principle instead of a SWF**
- Key question: what policies are more efficient than the income tax schedule at redistribution?
